

# Cheatsheet - Universal Set, Complement and Laws

Fabio Lama – fabio.lama@pm.me

---

## 1. Intro

A universal set is a set that contains everything. We note the universal set with the letter  $U$ .

$$A \subseteq U$$

## 2. Complement of a Set

The complement of set  $A$  contains all elements of  $U$  but not  $A$ .

$$\bar{A} = U - A$$

and therefore:

$$\bar{\bar{A}} \cup A = U$$

For example:

$$U = \{1, 2, 3, 4\}$$

$$A = \{1, 2\}$$

$$\bar{A} = \{3, 4\}$$

$$A \cup \bar{A} = \{1, 2, 3, 4\} = U$$

## 3. De Morgan's Law

The complement of the **union** of two sets  $A$  and  $B$  is equal to the **intersection** of their complements.

$$\overline{A \cup B} = \bar{A} \cap \bar{B}$$

The complement of the **intersection** of two sets  $A$  and  $B$  is equal to the **union** of their complements.

$$\overline{A \cap B} = \bar{A} \cup \bar{B}$$

For example:

$$U = \{1, 2, 3, 4, 5, 6, 7, 8\}$$

$$A = \{1, 2, 3, 4\} \text{ and } B = \{4, 5, 6\}$$

$$A \cup B = \{1, 2, 3, 4, 5, 6\} \text{ and } A \cap B = \{4\}$$

$$\overline{A \cup B} = \{7, 8\} \text{ and } \overline{A \cap B} = \{1, 2, 3, 5, 6, 7, 8\}$$

$$\bar{A} = \{5, 6, 7, 8\} \text{ and } \bar{B} = \{1, 2, 3, 7, 8\}$$

We conclude:

$$\overline{A \cup B} = \{7, 8\} = \bar{A} \cap \bar{B}$$

$$\overline{A \cap B} = \{1, 2, 3, 5, 6, 7, 8\} = \bar{A} \cup \bar{B}$$

## 4. Laws of Sets

### 4.1. Commutativity

Unions, intersections and symmetric differences are commutative.

$$A \cup B = B \cup A$$

$$A \cap B = B \cap A$$

$$A \oplus B = B \oplus A$$

Set difference is **not** commutative.

$$A - B \neq B - A$$

For example:

$$A = \{1, 2, 3\}$$

$$B = \{3, 4, 5\}$$

$$A - B = \{1, 2\}$$

$$B - A = \{4, 5\}$$

## 4.2. Associativity

Unions, intersections and symmetric differences are associative.

$$A \cup (B \cup C) = (A \cup B) \cup C$$

$$A \cap (B \cap C) = (A \cap B) \cap C$$

$$A \oplus (B \oplus C) = (A \oplus B) \oplus C$$

Set difference is **not** associative:

$$A - (B - C) \neq (A - B) - C$$

For example:

$$A = \{1, 2, 3\}$$

$$B = \{3, 4, 5\}$$

$$C = \{3\}$$

$$A - (B - C) = \{1, 2, 3\}$$

$$(A - B) - C = \{1, 2\}$$

## 4.3. Distributive

Unions and intersections are distributive.

$$A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$$

$$A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$$

# 5. Set Identities

## 5.1. Unions

$$A \cup B = B \cup A$$

$$(A \cup B) \cup C = A \cup (B \cup C)$$

$$A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$$

$$\overline{A \cup B} = \bar{A} \cap \bar{B}$$

$$A \cup \phi = A$$

$$A \cup U = U$$

$$A \cup \bar{A} = U$$

$$\bar{\bar{U}} = \phi$$

$$\bar{\bar{A}} = A$$

$$A \cup (A \cap B) = A$$

$$A - B = A \cap \bar{B}$$

## 5.2. Intersections

$$A \cap B = B \cap A$$

$$(A \cap B) \cap C = A \cap (B \cap C)$$

$$A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$$

$$\overline{A \cap B} = \bar{A} \cup \bar{B}$$

$$A \cap \phi = \phi$$

$$A \cap U = A$$

$$A \cap \bar{A} = \phi$$

$$\bar{\bar{\phi}} = U$$

$$A \cap (A \cup B) = A$$

# 6. Partition Set

The two sets  $A$  and  $B$  are **disjoint** if and only if  $A \cap B = \phi$ .

For example:

$$\begin{aligned} A &= \{1, 2, 3\} \\ B &= \{4, 5, 6\} \\ A \cap B &= \phi \quad (\text{disjoint}) \end{aligned}$$

The set  $A$  consists of subsets  $A_1$ ,  $A_2$  and  $A_3$  such that those subsets are disjoint and the union of all those subsets is equal to  $A$ :

$$\begin{aligned} A &= \{1, 2, 3, 4, 5, 6, 7, 8\} \\ A_1 &= \{1, 2, 3\} \\ A_2 &= \{4, 5, 6\} \\ A_3 &= \{7, 8\} \\ A_1 \cap A_2 \cap A_3 &= \phi \\ A &= A_1 \cup A_2 \cup A_3 \end{aligned}$$

Hence,  $A_1$ ,  $A_2$  and  $A_3$  are **partitions** of set  $A$ .
